

1. Part 1

- a. How many classes are provided to you in the Python file for lab7\_problem.py?
  - i. 3 Classes
- b. What are the names of the classes provided to you?
  - i. Resistor
  - ii. Series
  - iii. Parallel
- c. List the methods associated with each class.
  - i. Resistor
    1. get\_multimeter\_range()
    2. get\_resistance()
    3. set\_resistance()
  - ii. Series
    1. get\_resistance()
  - iii. Parallel
    1. get\_resistance()
- d. To complete this lab assignment, note down the name of the functions and line numbers where you need to work on the code.
  - i. Resistor
    1. get\_multimeter\_range()
      - a. 22
    2. get\_resistance()
      - a. 39
    3. set\_resistance()
      - a. 56
  - ii. Series
    1. get\_resistance()
      - a. 102
  - iii. Parallel
    1. get\_resistance()
      - a. 125
  - iv. Else
    1. 142
- e. Write the goal of this lab assignment in 1-2 sentences before working on the code. By reading the provided code, what do you understand?
  - i. Be Able to use Classes to simplify code and make it easily expandable

2. Part 5

- a.

Resistance combination	Value in Code	Value in Experiment	Percentage Error	Multimeter range used	Image
Resistor 1	1000	976	-2.4%	2000	
Resistor 2	100	98.6	-1.4%	200	
Resistor 3	3300	3240	-1.8182%	20000	
Series ([Resistor1, Resistor2])	1100	1075	-2.2727%	2000	
Parallel([Resistor1, Resistor2])	90.90909 ...	89.8	-1.22%	200	
Series([Resistor1, Resistor2, Resistor3])	4400	4310	-2.0455%	20000	
Parallel([Resistor1, Resistor2, Resistor3])	88.47	87.2	-1.4355%	200	

### 3. Part 6

- Classes are fun and helpful for simplifying.
- 1.5 hours
